The Brook Crompton - Bull dc motor range

Introduction

Bull Electric is the specialist dc motor manufacturing arm of the international Brook Crompton organisation. Brook Crompton manufactures one of the world's most comprehensive ranges of motors.

Its factories are located throughout Europe, Poland and China.

Bull Electric was established in 1898 and is now acknowledged as a leader in dc motor design and manufacture. Its products are in service across the world in most applications which benefit from the high performance of dc drives:

- Mechanical handling
- Elevators
- Steel mills
- Pulp or paper
- Wire drawing
- Plastics manufacturing
- Test equipment
- Exercise machines
- Machinery drives
- Printing

DC Motor Range

Bull Electric motors cover outputs from 0.09kW to 750kW in frame sizes 63 to 355.

Typical features of the range include:-

- Class H materials but class F temperature rise
- Wide speed range, typically 100:1 (IC06 + IC410), 20:1 (IC01 + IC411)
- Armatures designed to reduce low speed pulsations
- Choice of enclosure
- Wide range of specifications
- Brushwear detection option on MKIII range

Quality

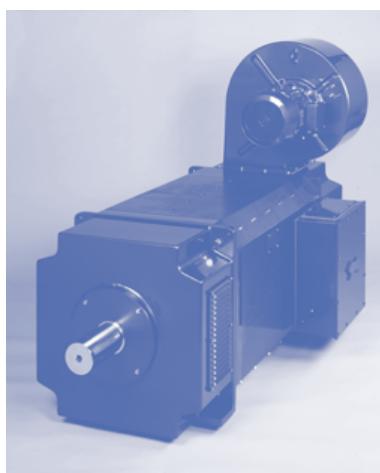

Bull Electric motor manufacturing operations hold BS EN ISO 90001:1994 approval.

Standards and Environment

DC motors can be manufactured to the standards of countries listed below

Table 2: Standards

Motors are manufactured to the following standards:

Range	International	National Standard	DIN	NF	N. American*
Standard	IEC	BS	DIN	NF	NEMA
Dimensions	IEC 72-1	BS4999 Part 141	DIN 42673, DIN 42677	NF C51-105, NF C51-120	MG1 Part 4
Mounting	IEC 34-7	BS4999 Part 107	DIN 42950	NF C51-117	MG1 Part 4
Degrees of Protection	IEC 34-5	BS4999 Part 105	DIN 40050	NF C51-115	MG1-1.26B

Standard motor complies

Optional

Motors complying with IEC 34-1 also comply with many of the National Standards of other European countries

e.g. C.E.I. 203 (Italy), NBN7 (Belgium), NEN 3173 (Netherlands), SEN 2601 01 (Sweden).

* Motors to NEMA standards have CSA approval and generally comply with Canadian (EEMAC) standards. For full details of NEMA standard motors, refer to Bull Electric.

Enclosure

All motors have degrees of IP protection as defined in IEC 34-1 (EN 60034 Part 5), as detailed in Tables 3.

Insulation

All motors are insulated with a Class H insulation system.

Thermal Rating

Standard motors will operate satisfactorily in an ambient temperature range of -10°C (-30°C-MD range) to +40°C (class F temperature rise) and at altitudes up to 1000 metres above sea level.

High Ambient Temperatures and High Altitude

The ratings listed in this catalogue apply to standard motors operating in ambient temperatures not exceeding 40°C and altitudes up to 1000m above sea level.

When operating a standard motor in higher ambient temperatures or at higher altitudes, derating may be necessary in order to maintain its operating temperature limit. Refer to works.

Motor Cooling

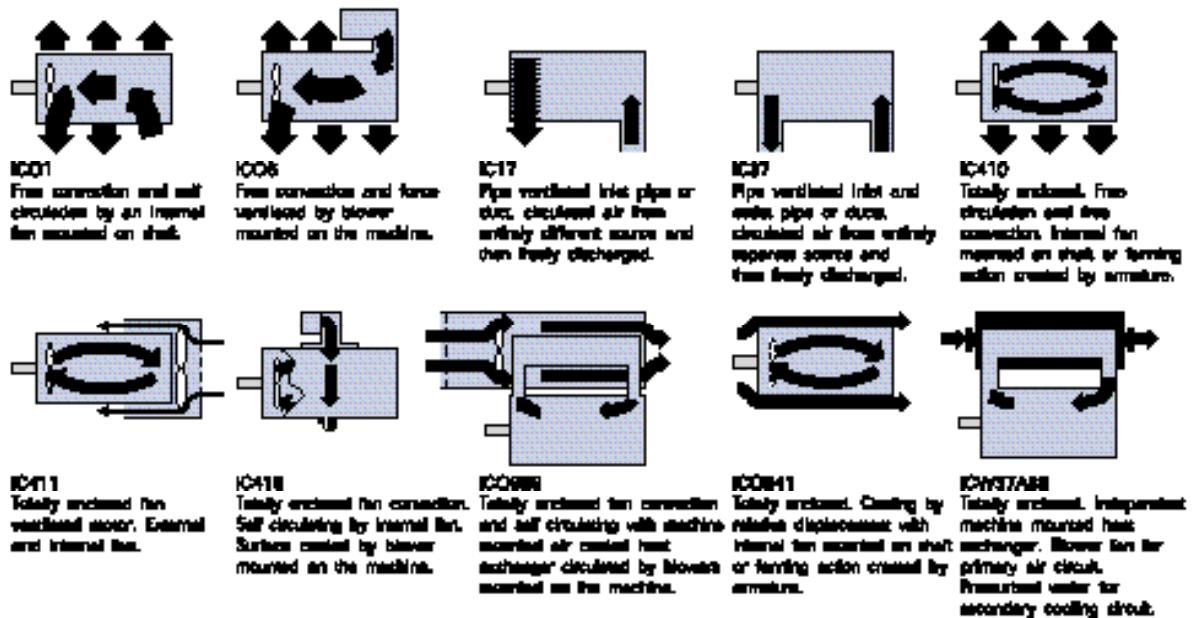

Motors are cooled in accordance with BS EN 60034-6. Methods of cooling are detailed on table 6, page 6.

Table 3: Enclosure description

Brief Description	
1st Numeral	2nd Numeral
Protection Against Solid Objects	
2	Motor enclosure protected against the harmful ingress of solid objects greater than 12mm diameter
3	Motor enclosure protected against the harmful ingress of drops of water falling at 60° to the vertical
4	Motor enclosure protected against the harmful ingress of small objects greater than 1mm diameter
5	Motor enclosure protected against the harmful ingress of dust
Protection Against Liquids	
2	Motor enclosure protected against the harmful ingress of vertical drops of water
4	Motor enclosure protected against the harmful ingress of splashing water (10L/min @ 1.0 bar)
5	Motor enclosure protected against the harmful ingress of water, when water is sprayed against the motor enclosure (12.5L/min @ 0.3 bar)

Environment

Table 6: Standard cooling arrangements

Cooling

Standard cooling arrangements vary within and between the ranges. Cooling forms shown are the different variations we can offer. They are not all necessarily available for every motor. All conform with IEC34-6 and BS4999: Part 106.

Paint

All motors are externally treated for operation in environmentally hostile conditions with good resistance to chemicals and oils. The standard colour for all motors is BS4800 20D45 (Blue). Other colours and paint systems are available, details from Bull Electric.

Rating Plate

All rating plates are laser etched anodised aluminium.

Technical information - electrical

Variable Speed Drives

Variable speed drives may be applied to accelerate or decelerate in either or both directions, against constant torque loads, constant power loads, or loads where both the power and torque vary. They may thus be used to control variables such as speed, flow rate, tension, thickness, density, temperature, etc.

Constant Torque Applications

The torque required to drive the load is approximately constant regardless of speed and hence the power varies directly with speed. Applications include:

- Extruders
- Conveyors
- Treadmills
- Paper and printing
- Rubber extrusion

Constant Power Applications

The power required to drive the load does not vary with speed and hence the torque varies inversely with speed. Applications include:

- Re-wind stands
- Machine tools
- Crane hoists
- Wire drawing
- Dynamometers

Torque and Power

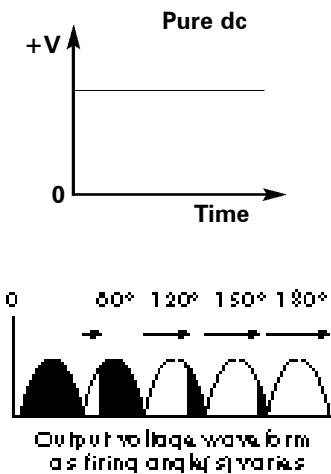

These type of applications vary the torque with the square of the speed and the power with the cube of the speed. In these cases it is usual to supply a drive capable of working against constant torque but to take the reduced torque and power requirements at the lower speeds.

Applications include:

- Centrifugal fans and pumps

Form Factor

Form factor describes the smoothness of a rectified dc waveform.

The most common sources of dc supply are:

- Battery (pure dc - form factor 1.0)
- Thyristor converter (rectified dc)
- PWM converter

Supplies originating from a thyristor converter are unable to achieve pure dc and hence have a certain amount of waveform ripple. The amount of ripple is designated by a form factor e.g. 1.05. A poor form factor e.g. 1.4 will significantly affect the performance of small dc motors such as; MP and MD ranges. To offset the impaired performance it is necessary to derate the motor to maintain the temperature rise and reduce the risk of excessive sparking at the commutator.

Form factor can often be improved by the addition of inductance (e.g. a choke) in the armature circuit. If in doubt, please contact your controls supplier.

Definition: $FF = \frac{I_{rms}}{I_{av}}$

Where: FF - Form Factor
 I_{rms} - Root Mean Square Current
 I_{av} - Average Current

Motor Types

Motors are designed for a variety of applications, two of the common designs (shunt wound and permanent magnet) are detailed below. Designs including compound wound motors are available. Details available from Bull Electric.

Shunt Wound

Shunt motors with separately-excited fields are the popular choice where speed control is required over a wide range. If the field current is held constant and the armature voltage reduced, then infinite speed range can be obtained down to zero speed with constant torque capability. If the armature voltage is held constant and the field current is reduced, then speed increase over a limited range of 2:1 or 3:1 can be achieved with constant power output capability, commutation and stability being the limiting factors.

Field trimming can be applied in order to equally match two or more similar motors being fed in parallel from the same armature supply source.

Technical information - electrical

Permanent Magnet Motor

The permanent magnet motor can be used in variable speed drive applications as a replacement for the separately-excited shunt motor with the advantage that there is no need for field supply, and the field excitation wiring between controller and motor is eliminated. Permanent magnet motors are manufactured with a smaller body diameter than an equivalent wound field motor. However permanent magnet motors do not have the facility of field trimming.

Since current is a standard feature of the variable speed drive and provided the magnitude of peak current is known, motors will be designed for minimal magnet demagnetization. An effect caused by armature reaction.

Where applicable, the motor can be designed to replace the compound-wound motor for direct-on-line starting without demagnetizing the magnets.

It must be borne in mind that the magnet's temperature coefficient is $-0.2\%/\text{°C}$. This is a reversible characteristic but will result in speed increase as the motor temperature increases. It also reduces the value of peak armature reaction current which will cause irreversible demagnetization if applied under low ambient temperature conditions.

Protection Devices

To protect the motor windings against a variety of operational malfunctions, motors and associated control gear can be fitted with thermostats* or thermistors*.

Thermostats are the standard device. They are usually fitted into one of the shunt coils to detect excessive heating of the shunt coils and into an interpole winding to detect excessive load current in the armature circuit or inadequate supply of cooling air.

* Not applicable to the MP range.

Thermostats

These are bi-metallic normally closed contact devices and suitable for connection into a 250 volt ac relay circuit, 1 amp resistive. Details available from Bull Electric.

Table 9: Protection Devices

Motor Fault	Thermostats	Thermistors
Sustained overload	G	G
Excessive or incorrect duty cycle	A	G
Prolonged reduced or over voltage	G	G
Excessive ambient temperature in motor location	G	G
Restricted or impaired ventilation	G	G

Key: G – good; A – acceptable;

Thermistors

Thermistors to IEC34-1, DIN 44081/440823 are temperature-dependant, semi-conductor devices. They have a positive temperature co-efficient, usually with a fixed activating temperature of 160°C (other thermistors for different temperature are available).

Other types of temperature detection can be fitted on request. Details available from Bull Electric.

It should be noted that thermal devices are fitted as an aid towards protection, but due to differences in thermal time constraints between the coils and the devices, they should not be considered as a complete protection system.

Stall current

All force ventilated motors are suitable for continuous operation at 1% of the rated speed. However, the values of current and duration detailed in Table 10 are permissible with the motor at standstill providing that the forced air ventilating system is in continuous operation.

Terminal Box

Position when viewed from the drive end.

Table 11: Terminal Box Positions

Type	Right	Top	Left
MP	RB	Std	RB
MD*	Std	RB	Alt
MKIII	Std	Alt	Alt

*Position of conduit entry, no terminal box fitted.
Std - Standard
Alt - Alternative
RB - Refer to Bull Electric

Overload/Overspeed

When operating at full field strength, an overload equal to 1.5 times rated torque can be applied in accordance with IEC34-1.

- Occasional excess current - not more than one minute
- Momentary excess torque - not more than 15 seconds
- After any periods of stall, the motor should be run continuously for a minimum of 10 minutes

For variations of the above, please contact Bull Electric for details.

Table 10: Stall current values and time duration

Current (%)	Time (seconds)
180	15
150	30
100	60
50	300
25	Continuously rated

Details of specific applications should be referred to Bull Electric.

Technical information - mechanical

Balance

All motors are dynamically balanced to ISO 2373 (BS4999 Part 142) with key convention to IEC 34-14, i.e. half key. Reduced and special balance* are available as an option.

Table 13 outlines the limits of vibration in severity (mm/s).

Lubrication

MK III range motors are provided with lubrication facilities.

Table 12: Grease

Grease Type	Temperature Range
Shell Albida LR2	-20°C to +150°C

MKIII Range

Brushgear is of the finger contact-constant pressure coil spring type. No adjustment of the brushes is necessary throughout the useful life of the brushes. Finger contact brush boxes suitable for use with a brush wear indicator system can be fitted on request. Details of the brush wear indicator system can be found on page 13.

Full details of brushes for each type of motor can be obtained from Bull Electric Ltd.

Bearing Loads

Axial and radial loads depend on a variety of factors:

- Motor speed
- Shaft type (length, diameter etc)
- Shaft fitment
- Load thrust direction
- Application

Details for specific motor designs are available from Bull Electric.

Table 13: Limits of Vibration

Grade	Min-1	Maximum R.M.S Velocity (mm/s)		
		Frames 71 to 132	Frames 160 to 225	Frames 250 to 355
N (Normal)	>600 ≤ 3600	1.8	2.8	4.5
R (Reduced)	>600 ≤ 1800	0.71	1.12	1.8
	>1800 ≤ 3600	1.12	1.8	2.8

	>1800 ≤ 3600	0.71		

*MP and MD ranges only. N/A - Not applicable

Bearings

Bearing sizes are detailed in Table 14.

MP and MD Ranges

- Double shielded or double sealed ball bearings fitted at both ends.

Shafts

Standard shafts are produced from steel to BS970 Part 1, 080M40, with a tensile strength of 550N/mm². Request for special shafts manufactured from other grades of steel should be given at the inquiry stage.

MKIII Range

132 to 280 frames

- Double shield or double sealed ball bearings fitted at commutator (non-drive) end. Bearing lubrication available on request
- Regreasable roller bearing fitted at the drive end

355 frames

- Regreasable ball bearing fitted at the commutator (non-drive) end
- Regreasable roller bearing fitted at the drive end

All bearings have sufficient grease to last for at least 2 years continuous use under normal operating conditions.

Details of grease or bearing life are available from Bull Electric.

Brushgear

Easy access to the brushgear for inspection or maintenance is via the non-drive end.

MP and MD Ranges

Brush boxes are brass with coil spring pressure applied fingers.

MKIII Range

MKIII Range

General

The MKIII range of dc metric motors provides exceptionally high outputs per unit weight combined with complete flexibility of speed control. MKIII has been designed for use on fixed speed or variable speed applications operating from pure dc or thyristor converter supplies.

The range covers outputs up to 750kW in 355 frame. Motors are continuously rated, having fully laminated frames for fast response up to (200 x p.u./sec) and rugged construction for wide application use.

Voltage

The preferred armature voltages are 440V and 460V, from either a 3 phase fully controlled thyristor converter*, or alternatively, from a pure dc source. Voltages between 240V and 600V can be accommodated.

The standard excitation supply is 340V or 370V, however alternative voltages to customers requirements are available.

* Where 1 phase or 3 phase half controlled supply is being considered, please refer details to Bull Electric.

Field System

The standard motor is shunt wound, however, a compound winding can be provided on request.
(Except for frame size 132).

A compensating winding is available for frame sizes 280 and 355.

Cooling

Normal ventilation is to IC06 - separate ventilation with fitted fan unit.

Other forms of cooling are available as detailed in Table 19.

Mechanical Features

The magnet frame is laminated construction. The endshields are of cast iron.

Mounting

The standard arrangement is foot mounted.

Terminals

Motor terminals are located in a terminal box.

Enclosure

The standard enclosure is designed to give IP23 protection, with up to IP55 available.

Tachogenerators

The following tachogenerators can be fitted on request:-

- REO 444N
- REO 444R
- RDC 14
- BD 2510B

The fitting of alternative types of tachogenerators can normally be accommodated.

Details from Bull Electric Ltd.

Optional Extras

A wide range of optional extras are available at extra cost including:

- Thermistors
- Thermostats
- Heaters
- Brake motors
- Speed sensing (Tacho or Encoder)
- Compound winding

Dimensions

Full dimensional data is detailed on pages 26/27.

Table 19: Alternative ventilation

Code	Description
IC17	Separate ventilation with inlet duct
IC37	Separate ventilation with inlet and outlet ducts
IC410	Totally enclosed self cooled
IC06 66	Totally enclosed with air/air heat exchanger (closed internal air circuit) Separate fan for internal and external cooling air
ICW37 A86	Totally enclosed with water/air heat exchanger (separate fan for internal air)

Brushwear detection system for MKIII DC motors

All the benefits of DC drives with low maintenance

The Bull Electric Brushwear Detection System enables the user to derive all the benefits of MKIII dc motors with planned maintenance cycles comparable to those of ac machines.

The system is designed to give an indication when brushes are approaching the end of their useful life and should be replaced. This avoids the risk of commutator damage and reduces the need for brush inspection to normal plant maintenance cycles.

- Allows rationalisation of plant maintenance.
- All brush boxes are monitored.
- No detection wires in brushes.
- Avoids commutator surface damage caused by 'Brush Pigtail Scoring'.
- Fully electronic solution.
- Warning light and circuit test facility at users preferred location.

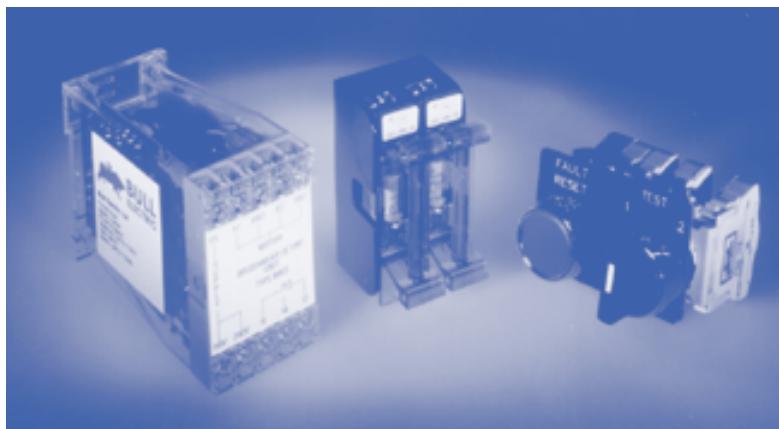

Specify on new motors or retrofit to old

From Spring 1993, MKIII dc motors have been fitted with a new style brush holder ring. This enables the Brushwear Detection System to be added on request when ordering MKIII motors.

The brush holder rings, incorporating the brush contacts, can also be supplied for retrofitting the system to older MKIII motors.

If in doubt about whether existing motors are suitable for retrofit, please contact Bull Electric with the motor serial number.

For technical specification of the brush-wear detection system please contact Bull Electric.
