Industrial Automation

High-efficiency 3-phase induction motors for variable speed control **LSMV**

0.75 to 132 kW

Technical catalogue

4981 en - 2014.07 / c

A world-class product

Guaranteed variable speed performance

Leroy-Somer is expanding its induction motor offer with a range specially adapted for variable speed. Combined with any type of frequency inverter, the LSMV offers solutions adapted to the industrial environment by producing electrical performance with IE2 efficiency level and mechanical performance by guaranteeing constant torque over a wide operating range without forced ventilation and without derating.

Interchangeability

The LSMV motor retains the IEC60072-1 dimensions (frame size, mounting distance and shaft diameter) while an induction motor designed to operate on the mains would be derated according to the operating range.

Modularity and simplicity

In order to satisfy the demands of the process, the LSMV easily integrates speed sensors (incremental or absolute encoders, resolvers, bearing sensors, etc), as well as brakes and/or forced ventilation.

Designation

IP 55
Cl. F - ΔT 80 K

The complete motor reference described below will enable you to order the desired equipment.

The selection method consists of following the terms in the designation.

Description

Description	Materials	Comments
1 Housing with cooling fins	Aluminium alloy	<ul style="list-style-type: none"> - with integral or screw-on feet, or without feet - die-cast for frame size ≤ 180 - gravity die-cast for frame size ≥ 200 • 4 or 6 fixing holes for housings with feet • lifting rings for frame size ≥ 100 - earth terminal with an optional jumper screw
2 Stator	Insulated low-carbon magnetic steel laminations Electroplated copper	<ul style="list-style-type: none"> - low carbon content guarantees long-term lamination pack stability - semi-enclosed slots - magnetic circuit based on acquired experience in frequency control - impregnation making it possible to withstand the sudden voltage variations caused by the high switching frequencies of IGBT transistor drives in accordance with IEC 34-17 - class F insulation - thermal protection provided by 3 PTC probes (1 per phase)
3 Rotor	Insulated low-carbon magnetic steel laminations Aluminium	<ul style="list-style-type: none"> - inclined cage bars - rotor cage pressure die-cast in aluminium (or alloy for special applications) - shrink-fitted to shaft and keyed for hoisting applications - rotor balanced dynamically, class B for frame size ≤ 132
4 Shaft	Steel	
5 End shields	Cast iron	- frame size 80 to 315
6 Bearings and lubrication		<ul style="list-style-type: none"> - permanently greased bearings frame size 80 to 225 - regreasable bearings frame size 250 to 315 - bearings preloaded at non drive end
7 Labyrinth seal Lipseals	Plastic or steel Synthetic rubber	<ul style="list-style-type: none"> - lipseal or deflector at drive end for all flange mounted motors - lipseal, deflector or labyrinth seal for foot mounted motors
8 Fan	Composite material	- 2 directions of rotation: straight blades
9 Fan cover	Pressed steel	- fitted, on request, with a drip cover for operation in vertical position, shaft end facing down (steel cover)
10 Terminal box	Aluminium alloy	<ul style="list-style-type: none"> - fitted with a terminal block with steel terminals as standard (brass as an option) - terminal box fitted with plugs, supplied without cable glands (cable glands as an option) - 1 earth terminal in each terminal box - fixing system consisting of a cover with captive screws

Choice of application type

In principle, there are three typical types of load. It is essential to determine the speed range and the application torque (or power) in order to select the drive system:

CENTRIFUGAL MACHINES

The torque varies as the square of the speed (or cube of the power). The torque required for acceleration is low (about 20% of rated torque). The starting torque is low.

- Sizing: depends on the power or torque at maximum speed
- Drive selected for normal duty

Typical applications: ventilation, pumping, etc

CONSTANT TORQUE MACHINES

The torque remains constant throughout the speed range. The torque required for acceleration may be high, depending on the machine (higher than the rated torque).

- Sizing: depends on the torque required over the entire speed range
- Drive selected for heavy duty

Typical machines: extruding machines, grinders, travelling cranes, presses, etc

CONSTANT POWER MACHINES

The torque decreases as the speed increases. The torque required for acceleration is no more than the rated torque. The starting torque is at its maximum.

- Sizing: depends on the torque required at minimum speed and the range of operating speeds.
- Drive selected for heavy duty
- An encoder feedback is advisable for improved regulation

Typical machines: winders, machine tool spindles, etc

4-QUADRANT MACHINES

These applications have a torque/speed operating type as described above, but the load becomes a driving load in certain stages of the cycle.

- Sizing: see above depending on the load
- In the case of repetitive braking, install a reinforced insulation system (RIS)
- Drive selection: to dissipate the power from a driving load, it is possible to use a braking resistor, or to send power back to the grid. In the latter case, a regenerative or 4-quadrant drive should be used.

Typical machines: centrifuges, travelling cranes, presses, machine tool spindles, etc

Choice of number of poles, optional features and brake

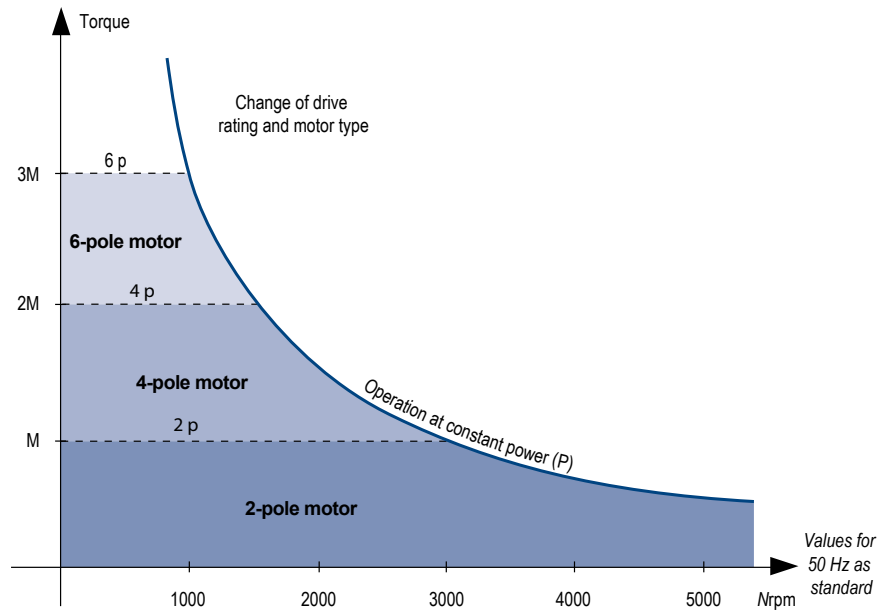

NUMBER OF POLES

The number of poles is one of the main criteria.

In fact, as can be seen in the graph opposite, the torque is distributed differently depending on the number of motor poles used.

Therefore, for use only at low speed, a 6-pole motor should be chosen.

Conversely, for overspeed operation the 2-pole motor should be selected.

OPERATING EXTENSIONS

Depending on the applications and speed controllers, certain accessories are needed:

Forced ventilation unit:

- For low-speed operation ($< n_N/2^*$ for the LSES motor and $< n_N/10^*$ for the LSMV) in continuous duty
- For high-speed operation (special design)

Encoder:

- For operation on a flux vector drive
- For speeds below $n_N/10^*$
- To obtain the speed accuracy needed by some servo systems

* n_N = rated speed

BRAKE

For operation on a drive, the brake is determined according to the number of starts per hour and the inertia factor.

$$\text{Inertia factor} = (J_c + J_m) / J_m$$

J_m : Brake motor inertia

J_c : Load inertia on the motor

		Inertia factor		
		0.1	1	10
Emergency stops per hour	1	BK	BK	FCR - FCPL
	10	BK	FCR - FCPL	FCR - FCPL
	100	BK	FCR - FCPL	FCR - FCPL

Choice of motor

MOTOR PERFORMANCE AS A FUNCTION OF THE TORQUE AND THE SPEED RANGE IN S1 CONTINUOUS DUTY - 4P 1500 rpm

DT105 = Temperature rise F curve
DT80 = Temperature rise B curve
Tnom = Rated torque curve

2.3 A = Current on drive at DT105
2.0 A = Current on drive at DT80
1.8 A = Current on drive at rated torque

To guarantee the LSMV motor performance, the drive rating should be compatible with the current of the selected curve.

All the performance curves have been carried out with a self-cooled LSMV motor and a drive supplied on a 400 V-50Hz mains power supply in open loop flux vector mode and under normal operating conditions:

- Ambient temperature 40°C max.
- Altitude 1000 m max.

Selection example:

For a torque of 5.4 Nm (i.e. 110% of T/Tn) from 500 to 1800 rpm:

- selection: standard 1.1 kW motor + drive
- selection: 0.75 kW LSMV motor + 2.3 A drive

Using the motor at constant torque from 0 to 87 Hz

An LSMV motor used with a Δ connection combined with a frequency inverter increases the constant torque range from 50 to 87 Hz, which can increase the power by the same ratio.

The size of the frequency inverter is determined by the current value in 230 V and programmed with a voltage/frequency ratio of 400 V 87 Hz.

Example of selection with 4 poles:

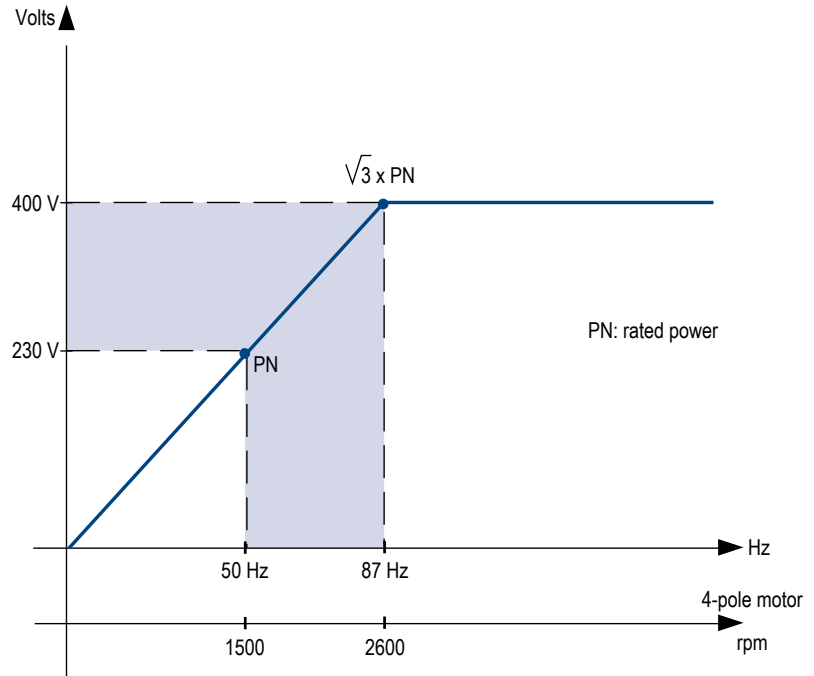

- For constant torque of 195 Nm from 600 to 2500 rpm:
- > selection: 30 kW 4P LSMV motor + 100 A drive

Example of selection with 2 poles:

- For constant power of 4 kW from 6000 to 8500 rpm:
- > selection: 3 kW 2P LSMV motor + 11 A drive

CAUTION: Max. mechanical speed to be complied with (see "Vibration level and maximum speeds" section).

Installation

INFLUENCE OF THE MAINS SUPPLY

Each industrial power supply has its own intrinsic characteristics (short-circuit capability, voltage value and fluctuation, phase imbalance, etc) and supplies equipment some of which can distort its voltage either permanently or temporarily (notches, voltage dips, overvoltage, etc).

The quality of the mains supply has an impact on the performance and reliability of electronic equipment, especially variable speed drives.

EQUIPOTENTIAL BONDING

The equipotential earth bonding of some industrial sites is sometimes neglected.

This lack of equipotentiality leads to leakage currents which flow via the earth cables (green/yellow), the machine chassis, the pipework, etc and also via the electrical equipment.

In some extreme cases, these currents can trip the drive.

It is essential that the earth network is designed and implemented by the installation supervisor so that its impedance is as low as possible, so as to distribute the fault currents and high-frequency currents without them passing through electrical equipment. Metal grounds must be mechanically connected to each other with the largest possible electrical contact area.

Under no circumstances can earth connections designed to protect people, by linking metal grounds to earth via a cable, serve as a substitute for ground connections (see IEC 61000-5-2).

The immunity and radio-frequency emission level are directly linked to the quality of the ground connections.

CONNECTION OF CONTROL CABLES AND ENCODER CABLES

CAUTION: Strip back the shielding on the metal clamp collars in order to ensure 360° contact.

Installation

The following information is given for guidance only, and should never be used as a substitute for the current standards, nor does it relieve the installer of his responsibility.

Depending on the installation, more optional elements can be added to the installation:

Drive power supply cables: These cables do not necessarily need shielding. Their cross-section is recommended in the drive documentation, however, it can be adapted according to the type of cable, installation method, cable length (voltage drop), etc. See section below "Sizing power cables".

Motor power supply cables: These cables must be shielded to ensure EMC conformance of the installation. The cable shielding must be connected over 360° at both ends. At the motor end, special EMC cable glands are available as an option. The cable cross-section is recommended in the drive documentation, however, it can be adapted according to the type of cable, installation method, cable length (voltage drop), etc. See section below "Sizing power cables".

Encoder cables: Shielding the sensor cables is important due to the high voltages and currents present at the drive output. This cable must be laid at least 30 cm away from any power cables. See "Encoders" section.

Sizing power cables: The drive and motor power supply cables must be sized according to the applicable standard, depending on the design current stated in the drive documentation. The different factors to be taken into account are:

- The installation method: in a conduit, a cable tray, suspended, etc
- The type of conductor: copper or aluminium.

Once the cable cross-section has been determined, check the voltage drop at the motor terminals. A significant voltage drop results in an increase in the current and additional losses in the motor (temperature rise).

A variable speed drive and transformer system which have been earthed in accordance with good practice will contribute significantly to reducing the voltage on the shaft and the motor casing, resulting in fewer high-frequency leakage currents. Premature breakage of bearings and auxiliary equipment, such as encoders, should also be avoided wherever possible.

Adaptation of the LSMV motor

A motor is always characterised by the following parameters, which depend on the design:

- Temperature class
- Voltage range
- Frequency range
- Thermal reserve

CHANGES IN MOTOR PERFORMANCE

When power is supplied by a drive, changes are observed in the above parameters due to certain phenomena:

- Voltage drops in the drive components
- Current increase in proportion with the decrease in voltage
- Difference in motor power supply according to the type of control (flux vector or U/F)

The main consequence is an increase in the motor current resulting in increased copper losses and therefore a higher temperature rise in the winding (even at 50 Hz).

Reducing the speed leads to a reduction in air flow and hence a reduction in cooling efficiency, and as a result the motor temperature rise will increase again. Conversely, in prolonged operation at high speed, the fan may make excessive noise, and it is advisable to install a forced ventilation system.

Above the synchronous speed, the iron losses increase and hence cause further temperature rise in the motor.

The type of control mode influences temperature rise in the motor:

- A U/F ratio gives the fundamental voltage maximum at 50 Hz but requires more current at low speed to obtain a high starting torque and therefore generates a temperature rise at low speed when the motor is poorly ventilated.

- Flux vector control requires less current at low speed while providing significant torque but regulates the voltage at 50 Hz and causes a voltage drop at the motor terminals, therefore requiring more current at the same power.

Consequences on the motor

Reminder: Leroy-Somer recommends the connection of PTC sensors, monitored by the drive, to protect the motor as much as possible.

CONSEQUENCES OF POWER SUPPLIED BY DRIVES

When power is supplied to the motor by a variable speed drive with diode rectifier, this causes a voltage drop (~5%). Some PWM techniques can be used to limit this voltage drop (~2%), to the detriment of the machine temperature rise (injection of harmonics of orders 5 and 7).

The non-sinusoidal signal (PWM) provided by the drive generates voltage peaks at the winding terminals due to the significant voltage variations relating to switching of the IGBTs (also called dV/dt). Repeated overvoltages can eventually damage the windings depending on their value and/or the motor design.

The value of the voltage peaks is proportional to the supply voltage. This value can exceed the minimum voltage for the windings which is related to the wire grade, the impregnation type and the insulation that may or may not be present in the slot bottoms or between phases.

Another reason for attaining high voltage values is when regeneration phenomena occur in the case of a driving load, hence the need to prioritise freewheel stops or following the longest permissible ramp.

Recommendations concerning the motor winding depending on the supply voltage

LEROY-SOMER applies a range of motor solutions in order to minimise risks:

- "Star" connections whenever possible
- Serial winding whenever possible
- Deceleration following the longest possible ramp
- Ideally, do not use the motor at the limits of its insulation class

These solutions are preferable to filters at the drive output, which accentuate the voltage drop and thus increase the current in the motor.

The insulation system for Leroy-Somer motors can be used on a drive without modification, regardless of the size of the machine or the application, at a supply voltage ≤ 480 V 50/60 Hz and can tolerate voltage peaks up to 1500 V and variations of 3500 V/ μ s. These values are guaranteed without using a filter at the motor terminals.

For a supply voltage > 480 V, other precautions should be taken to maximise motor life. Leroy-Somer's reinforced insulation system (RIS) must be used unless otherwise agreed by Leroy-Somer or a sine filter is used, taking account of the voltage drop at the motor terminals (only compatible with a U/F control mode).

Recommendations for rotating parts

The voltage wave form at the drive output (PWM) can generate high-frequency leakage currents which can, in certain situations, damage the motor bearings.

This phenomenon is amplified with:

- High mains supply voltages
- Increased motor size
- Incorrectly earthed variable speed drive system
- Long cable length between the drive and the motor
- Motor incorrectly aligned with the driven machine

Leroy-Somer machines which have been earthed in accordance with good practice need no special options except in the situations listed below:

- For voltage ≤ 480 V 50/60 Hz, and frame size ≥ 315 mm, we recommend using an insulated NDE bearing.
 - For voltage > 480 V 50/60 Hz, and frame size ≥ 315 mm, it is advisable to fit the motor with two insulated bearings, especially if there is no filter at the drive output.
- If there is one, only one insulated NDE bearing is recommended.

Adaptation of the LSMV motor

Good wiring practice

It is the responsibility of the user and/or the installer to connect the variable speed drive system in accordance with the current legislation and regulations in the country of use. This is particularly important as concerns cable size and connection of earths and grounds.

The following information is given for guidance only, and should never be used as a substitute for the current standards, nor does it relieve the installer of his responsibility. For more information, please refer to technical specification IEC 60034-25.

A variable speed drive and transformer system which have been earthed in accordance with good practice will contribute significantly to reducing the voltage on the shaft and the motor casing, resulting in fewer high-frequency leakage currents. Premature breakage of bearings and auxiliary equipment, such as encoders, should also be avoided wherever possible.

To ensure the safety of personnel, the size of the earthing cables should be determined individually in accordance with local regulations.

For compliance with standard EN 61800-3, the power conductors between drive and motor must be shielded. Use a special variable speed cable: shielded with low stray capacity and with 3 PE conductors 120° apart (diagram below). There is no need to shield the drive power supply cables.

The variable speed drive wiring must be symmetrical (U,V,W at the motor end must correspond to U,V,W at the drive end) with the cable shielding earthed at both the drive end and motor end over 360°.

In the second industrial environment (if the user has an HV/LV transformer), the shielded motor power supply cable can be replaced with a 3-core + earth cable placed in a fully-enclosed metal conduit (metal cable duct for example). This metal conduit should be mechanically connected to the electrical cabinet and the structure supporting the motor. If the conduit consists of several pieces, these should be interconnected by braids to ensure earth continuity. The cables must be fixed securely at the bottom of the conduit.

The motor earth terminal (PE) must be connected directly to the drive earth terminal. A separate PE protective conductor is mandatory if the conductivity of the cable shielding is less than 50% of the conductivity of the phase conductor.

SUMMARY OF RECOMMENDED PROTECTION DEVICES

Mains voltage	Cable length ⁽¹⁾	Frame size	Winding protection	Insulated bearings
≤ 480 V	< 20 m	All frame sizes	Standard ⁽²⁾	No
	< 250 m	< 315	Standard ⁽²⁾	No
	> 20 m and < 250 m	≥ 315	RIS or drive filter ⁽³⁾	NDE
> 480 V and ≤ 690 V	< 20 m	≤ 160	Standard ⁽²⁾	No
	< 250 m	> 160 and < 315	RIS or drive filter ⁽³⁾	No
		> 160 and < 315		NDE
		≥ 315		NDE (or DE + NDE if no filter)

(1) Length of shielded cable, cumulative (length) per phase between motor and drive, for a drive with 3 kHz switching frequency.

(2) Standard insulation = 1500 V peak and 3500 V/μs.

(3) Drive filter: dV/dt reactance or sine wave filter.

Adjusting the switching frequency

The variable speed drive switching frequency has an impact on losses in the motor and the drive, on the acoustic noise and the torque ripple.

A low switching frequency has an adverse effect on temperature rise in motors.

LEROY-SOMER recommends a drive switching frequency of 3 kHz minimum.

In addition, a high switching frequency optimises the acoustic noise and torque ripple level.

Reinforced insulation

LSMV motors are compatible with power supplies with the following characteristics:

- $U_{rms} = 480 \text{ V max.}$
- Value of voltage peaks generated at the terminals: 1500 V max.
- Switching frequency: 2.5 kHz min.

However, they can be supplied under more severe conditions if additional protection is provided.

REINFORCED WINDING INSULATION

The main effect connected with supplying power via an electronic drive is overheating of the motor due to the non-sinusoidal shape of the signal. In addition, this can result in accelerated aging of the winding through the voltage peaks generated at each pulse in the power supply signal (see Figure 1).

For peak values greater than 1500 V, a super-insulation option for the winding is available over the entire range.

REINFORCED INSULATION OF THE MECHANICAL PARTS

Supplying power via a drive may affect the mechanical parts and can lead to premature wear of the bearings.

This is because, in any motor, a shaft voltage exists with respect to earth. This voltage, due to electro-mechanical asymmetry, creates a potential difference between the rotor and the stator. This effect may generate electrical discharges between balls and races and lead to a reduction in bearing life.

If power is supplied via a PWM drive, a second effect is added: high frequency currents generated by the IGBT output bridges of the drives. These currents attempt to spread towards the drive and therefore flow through the stator and via earth where the link between the casing, machine chassis and earth is correctly made.

Otherwise, it will flow via the least resistive path: end shields /bearings/ shaft/machine coupled to the motor. In these situations, therefore, protection for the bearings must be provided.

For this reason, an "insulated bearing" option is available over the entire range from a frame size of 200.

Insulated bearing characteristics

The outer races of the bearings are coated with a layer of electrically insulating ceramic.

The dimensions and tolerances of these bearings are identical to the standard ones used and can therefore be fitted instead, with no modifications to the motors. The breakdown voltage is 500 V.

Speed feedback

SELECTION OF POSITION SENSOR

The role of the encoder in a drive system is to improve the quality of motor-drive speed regulation irrespective of the load variation at the motor shaft or to enable positioning.

There are three different types of encoder:

Incremental		Absolute		Analogue
Binary	Analogue	Binary	Analogue	
Single-turn encoder TTL (5 V) HTL (10-30 V)	Single-turn encoder Sin/Cos	Single-turn/Multi-turn encoder SSI; BiSS-C; EnDat; Hiperface	Single-turn resolver	Single-turn D.C. Tachogenerator

The main encoder types are incremental encoders which in the event of a power cut do not memorise the position, or absolute, meaning that the driven machine can be restarted without taking the reference again.

Built into the motor, they are designed to work at high ambient temperatures and at a vibration level compatible with the motor requirements.

The mechanical design of the LSMV allows it to be self-cooled as standard and the brake and forced ventilation unit options, which are needed for the thermal aspect, to be combined at low speed ≤ 5 Hz and at high speed ≥ 75 Hz.

Incremental and absolute encoders are supplied as standard with male/female M23 connectors.

Speed feedback

INCREMENTAL ENCODERS

This pulse generator supplies a number of pulses on channels A,A/, B,B/, 0 marker, 0/ marker proportional to the speed.

A 1024-point encoder is sufficient for most applications. However, where stability at very low speed (<10 rpm) is required, use of a higher resolution encoder is recommended.

Connector wiring:

Terminal 1: 0V	Terminal 8: 0/
Terminal 2: +VDC	Terminal 9: NC
Terminal 3: A	Terminal 10: NC
Terminal 4: B	Terminal 11: NC
Terminal 5: 0	Terminal 12: NC
Terminal 6: A/	
Terminal 7: B/	Shielding/housing connector

View of M23 female connector base (anti-clockwise) at the user end

ABSOLUTE ENCODERS

Absolute encoders save the position in the revolution, or over several revolutions, in the event of a power cut. A reference point is no longer necessary.

Data is transmitted via different communication protocols (EnDat, Hiperface, SSI, BiSS-C, etc); some protocols are owned by a particular supplier (EnDat/Heidenhain and Hiperface/Sick).

In certain cases, SinCos or incremental data is also available.

Single-turn absolute encoders

The single-turn absolute encoder converts a rotation of the drive shaft into a series of "electrical encoded steps".

The number of steps per revolution is determined by an optical disk.

In general, one shaft rotation consists of 8192 steps, which corresponds to 13 bits. At the end of a complete encoder shaft revolution, the same values are repeated.

Multi-turn absolute encoders

The multi-turn absolute encoder saves the position in the revolution and also over several revolutions, with a maximum of 4096 revolutions.

Resolver

Powered by an A.C. voltage and consisting of a stator and a wound rotor, it produces two voltages which, when combined can be used to determine the rotor position.

The advantage of this sensor is its ruggedness (no electronics) and its excellent reliability in severe environments (high temperature, vibration, etc).

D.C. TACHOGENERATOR

The D.C. tachogenerator is a generator that delivers a DC voltage proportional to the speed. As standard, we propose type KTD3 hollow shaft Ø14 mm 20 V/1000 rpm.

Speed feedback

Brake

BK BRAKE

The BK brake is a single-disc (1) failsafe brake with two friction surfaces, which is used as a deceleration brake and/or an emergency brake.

Operating principle

Friction produced by a number of springs (2) generates a braking torque that can be used to hold different loads. The braking torque is transmitted from the hub (4) to the rotor 3 via splines. The friction linings provide a high level of braking torque with minimal wear. This component does not require either servicing or adjustment.

The brake is released by an electromagnetic field produced by the coil (5) when voltage is present at its terminals. The brakes are supplied ready to use (preset air gap) with the control cell mounted in the terminal box. A "manual release" option is available on request.

- 1 - Armature disc
- 2 - Pressure springs
- 3 - Rotor
- 4 - Hub
- 5 - Stator
- 6 - Socket screws

Power supply at 230 V:

Cell type: S08

Rectified voltage: 210 V full wave
Brake coil rated voltage: 190 V

Voltage at the brake terminals:

- 1 - UDC = 0.45 x UAC (400 V)
- 2 - UDC = 0.9 x UAC (230 V)

Power supply at 400 V:

Cell type: S08

Rectified voltage: 210 V half wave
Brake coil rated voltage: 190 V

Voltage at the brake terminals:

- 1 - UDC = 0.45 x UAC (400 V)
- 2 - UDC = 0.9 x UAC (230 V)

There is usually a delay before braking torque changes to continuous torque.

The trip times correspond to DC switching with induction voltage some five to ten times higher than the rated voltage.

The figure opposite shows the delay time t₁₁, rise time of braking torque t₁₂, engagement time t₁ = t₁₁ + t₁₂ and the time t₂.

The disengagement time is not changed by DC or AC switching. It can be made shorter with special devices with rapid excitation or overexcitation board.

- t₁ Engagement time
- t₂ Disengagement time (until M = 0.1 M_k)
- t₁₁ Delay time
- t₁₂ Rise time of braking torque

Forced ventilation

The motors are self-cooled as standard

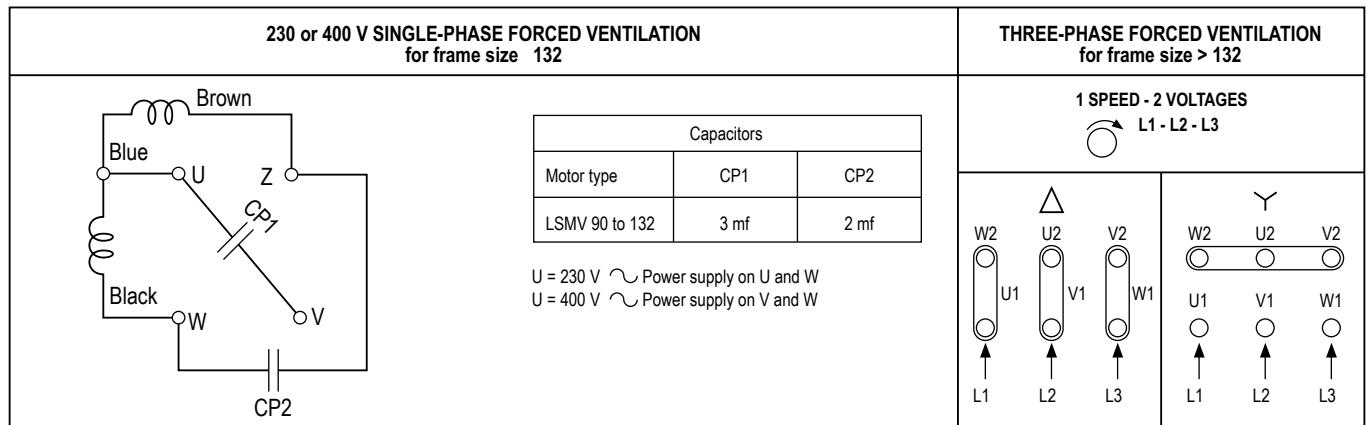

To maintain the rated torque over the entire speed range, forced ventilation may be necessary.

Characteristics of forced ventilation units

Motor type	FV Supply voltage ⁽¹⁾	FV consumption		Ingress protection ⁽²⁾ FV
		P (W)	I (A)	
LSMV 80 to 132	single-phase 230 or 400 V	100	0.43/0.25	IP55
LSMV 160 to 280 SD	three-phase 230/400 V 50 Hz 254/460 V 60 Hz	150	0.94/0.55	IP55
LSMV 280 MK LSMV 315 M	three-phase 230/400 V 50 Hz 254/460 V 60 Hz	750	3.6/2.1	IP55

(1) ± 10% for voltage, ± 2% for frequency.

(2) Ingress protection of the forced ventilation unit installed on the motor.

Thermal protection

The motors are fitted with PTC sensors as standard

The motors are protected by the variable speed drive, placed between the isolating switch and the motor. The variable speed drive provides total protection of the motor against overloads.

The motors are fitted with PTC sensors in the winding. As an option, specific thermal protection sensors can be selected from the table below.

It must be emphasized that under no circumstances can these sensors be used to carry out direct regulation of the motor operating cycles.

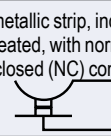

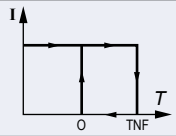

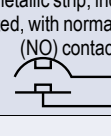

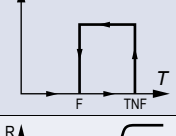

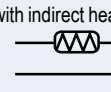

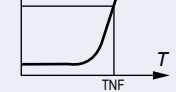

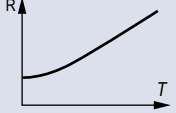

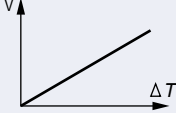

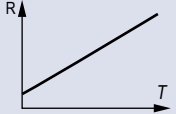

Fitting thermal protection

- PTO or PTF, in the control circuits
- PTC, with relay, in the control circuits
- PT 100 or thermocouples, with reading equipment or recorder, in the installation control panel for continuous surveillance

Alarm and early warning

All protective equipment can be backed up by another type of protection (with different NRTs): the first device will then act as an early warning (light or sound signals given without shutting down the power circuits), and the second device will be the alarm (shutting down the power circuits).

Built-in indirect thermal protection

Type	Operating principle	Operating curve	Breaking capacity (A)	Protection provided	Mounting Number of devices*
Normally closed thermal protection PTO	Bimetallic strip, indirectly heated, with normally closed (NC) contact 		2.5 A at 250 V with $\cos \phi$ 0.4	General monitoring for non-transient overloads	Mounting in control circuit 2 or 3 in series
Normally open thermal protection PTF	Bimetallic strip, indirectly heated, with normally open (NO) contact 		2.5 A at 250 V with $\cos \phi$ 0.4	General monitoring for non-transient overloads	Mounting in control circuit 2 or 3 in parallel
Positive temperature coefficient thermistor PTC	Variable non-linear resistor with indirect heating 		0	General monitoring for transient overloads	Mounted with associated relay in control circuit 3 in series
Temperature sensor KT Y	Resistance depends on the winding temperature		0	High accuracy continuous surveillance of key hot spots	Mounted in control boards with associated reading equipment (or recorder) 1 per hot spot
Thermocouples T ($T < 150^\circ\text{C}$) Copper Constantan K ($T < 1000^\circ\text{C}$) Copper-nickel	Peltier effect		0	Continuous surveillance of hot spots at regular intervals	Mounted in control boards with associated reading equipment (or recorder) 1 per hot spot
Platinum resistance thermometer PT 100	Variable linear resistor with indirect heating		0	High accuracy continuous surveillance of key hot spots	Mounted in control boards with associated reading equipment (or recorder) 1 per hot spot

- NRT: nominal running temperature.
- The NRTs are chosen according to the position of the sensor in the motor and the temperature rise class.
- standard $kTy = 84/130$

* The number of devices relates to the winding protection.

Mains connection

The motors are supplied with pre-drilled and tapped terminal boxes or an undrilled mounting plate for mounting cable glands

CABLE GLANDS

In certain applications, it is necessary for there to be earth continuity between the cable and the motor earth to ensure the installation is protected in accordance

with EMC directive 89/336/EU. An optional **cable gland with anchorage on shielded cable** is therefore available over the entire range.

Number and type of cable gland

Dimensions of optional features

LSMV MOTORS WITH OPTIONAL FEATURES

The integration of LSMV motors within a process often requires accessories to make operation easier:

- Forced ventilation for motors used at high or low speeds.

- Holding brakes for maintaining the rotor in the stop position without needing to leave the motor switched on.

- Emergency stop brakes to immobilise loads in case of failure of the motor torque control or loss of power supply.

- Encoders which provide digital information for accurate speed maintenance and position control.

These options can be used singly or in combination as shown in the table below.

External finish

Leroy-Somer motors are protected with a range of surface finishes. The surfaces receive appropriate special treatments, as shown below.

Preparation of surfaces

SURFACE	PARTS	TREATMENT
Cast iron	End shields	Shot blasting + Primer
Steel	Accessories	Phosphatization + Primer
	Terminal boxes - Fan covers	Electrostatic painting or Epoxy powder
Aluminium alloy	Housings - Terminal boxes	Shot blasting

DEFINITION OF ATMOSPHERES

An atmosphere is said to be harsh when components are attacked by bases, acids or salts. It is said to be corrosive when components are attacked by oxygen.

Paint systems

ATMOSPHERE	SYSTEM	APPLICATIONS	CORROSIVITY CATEGORY * ACC. TO ISO 12944-2
Non-harsh and not very harsh (indoors, rural, industrial)	Ia LSMV standard	1 polyurethane top coat, 20/30 µm	C3L
Moderately corrosive: humid, and outdoors (temperate climate)	IIa	1 Epoxy base coat, 30/40 µm 1 polyurethane top coat, 20/30 µm	C3M
Corrosive: maritime, very humid (tropical climate)	IIIa	1 Epoxy base coat, 30/40 µm 1 Epoxy intermediate coat, 30/40 µm 1 polyurethane top coat, 20/30 µm	C4M
Substantial chemical attack: frequent contact with bases, acids, alkalis Surroundings - neutral environment (not in contact with chlorinated or sulphurous products)	IIIb**	1 Epoxy base coat, 30/40 µm 1 Epoxy intermediate coat, 30/40 µm 1 Epoxy top coat, 25/35 µm	C4H
Special conditions. Very harsh, polluted with chlorinated or sulphurous products	Ve**	1 Epoxy base coat, 20/30 µm 2 Epoxy intermediate coats, each 35/40 µm 1 polyurethane top coat, 35/40 µm	C5I-M
	161b**	1 base coat, 50 µm 2 Epoxy intermediate coats, 80 µm 1 Epoxy top coat, 50 µm	C5M-M

System **Ia** is for moderate climates and System **IIa** is for general climates as defined in standard IEC 60721.2.1.

* Values given for information only since the surfaces vary in nature whereas the standard only takes account of steel surfaces.

** Evaluation of the degree of rusting in accordance with ISO 4628 (rusted area between 1 and 0.5%)

Leroy-Somer standard paint colour reference for LSMV motor range:

RAL 9005

Definition of “Index of Protection” (IP/IK)

In standard configuration, the LSMV motors are IP 55

Ingress protection of electrical equipment enclosures
In accordance with IEC 60034-5 - EN 60034-5 (IP) - IEC 62262 (IK)

1st number: Protection against solid objects			2nd number: Protection against liquids			3rd number: Mechanical protection		
IP	Tests	Definition	IP	Tests	Definition	IK	Tests	Definition
0		No protection	0		No protection	00		No protection
1	Ø 50 mm	Protected against solid objects of over 50 mm (example: accidental contact with the hand)	1		Protected against water drops falling vertically (condensation)	01	150 g 10 cm	Impact energy: 0.15 J
2	Ø 12 mm	Protected against solid objects of over 12 mm (example: a finger)	2	15°	Protected against water drops falling at up to 15° from the vertical	02	200 g 10 cm	Impact energy: 0.20 J
3	Ø 2.5 mm	Protected against solid objects of over 2.5 mm (examples: tools, wires)	3	60°	Protected against rain falling at up to 60° from the vertical	03	250 g 15 cm	Impact energy: 0.37 J
4	Ø 1 mm	Protected against solid objects of over 1 mm (examples: thin tools, small wires)	4		Protected against projected water from all directions	04	250 g 20 cm	Impact energy: 0.50 J
5		Protected against dust (no deposits of harmful material)	5		Protected against jets of water from all directions from a hose	05	350 g 20 cm	Impact energy: 0.70 J
6		Protected against any dust penetration	6		Protected against projected water comparable to big waves	06	250 g 40 cm	Impact energy: 1 J
			7	0.15m 1m	Protected against the effects of immersion between 0.15 and 1 m	07	0.5 kg 40 cm	Impact energy: 2 J
			8	..m	Protected against prolonged effects of immersion under pressure	08	1.25 kg 40 cm	Impact energy: 5 J
						09	2.5 kg 40 cm	Impact energy: 10 J
						10	5 kg 40 cm	Impact energy: 20 J

Example:

Example of an IP55 machine

IP : Ingress protection

- 5** : Machine protected against dust and accidental contact.
Test result: no dust enters in harmful quantities, no risk of direct contact with rotating parts. The test will last for 2 hours.
- .5** : Machine protected against jets of water from all directions from hoses at 3 m distance with a flow rate of 12.5 l/min at 0.3 bar.
The test will last for 3 minutes.
Test result: no damage from water projected onto the machine.

Mounting arrangements

Mountings and positions (IEC standard 60034-7)

Foot mounted motors

- all frame sizes

IM 1001 (IM B3)
- Horizontal shaft
- Feet on floor

IM 1071 (IM B8)
- Horizontal shaft
- Feet on top

IM 1051 (IM B6)
- Horizontal shaft
- Wall mounted with feet on left
when viewed from drive end

IM 1011 (IM V5)
- Vertical shaft facing down
- Feet on wall

IM 1061 (IM B7)
- Horizontal shaft
- Wall mounted with feet on right
when viewed from drive end

IM 1031 (IM V6)
- Vertical shaft facing up
- Feet on wall

(FF) flange mounted motors

- all frame sizes
(except IM 3001, which is limited to
frame size 225 mm)

IM 3001 (IM B5)
- Horizontal shaft

IM 2001 (IM B35)
- Horizontal shaft
- Feet on floor

IM 3011 (IM V1)
- Vertical shaft facing down

IM 2011 (IM V15)
- Vertical shaft facing down
- Feet on wall

IM 3031 (IM V3)
- Vertical shaft facing up

IM 2031 (IM V36)
- Vertical shaft facing up
- Feet on wall

(FT) face mounted motors

- all frame sizes ≤ 132 mm

IM 3601 (IM B14)
- Horizontal shaft

IM 2101 (IM B34)
- Horizontal shaft
- Feet on floor

IM 3611 (IM V18)
- Vertical shaft facing down

IM 2111 (IM V58)
- Vertical shaft facing down
- Feet on wall

IM 3631 (IM V19)
- Vertical shaft facing up

IM 2131 (IM V69)
- Vertical shaft facing up
- Feet on wall

Motors without drive end shield

Caution: The protection (IP) specified on the IM B9 and IM B15 motor nameplates is provided by the customer when the motor is assembled.

IM 9101 (IM B9)
- Threaded
tie rods
- Horizontal shaft

IM 1201 (IM B15)
- Foot mounted
with threaded tie rods
- Horizontal shaft

Vibration level and maximum speeds

VIBRATION LEVELS - BALANCING

Inaccuracies due to construction (magnetic, mechanical and air-flow) lead to sinusoidal (or pseudo sinusoidal) vibrations over a wide range of frequencies. Other sources of vibration can also affect motor operation: such as poor mounting, incorrect drive coupling, end shield misalignment, etc.

We shall first of all look at the vibrations emitted at the operating frequency, corresponding to an unbalanced load, whose amplitude swamps all other frequencies and on which the dynamic balancing of the mass in rotation has a decisive effect.

Under standard ISO 8821, rotating machines can be balanced with or without a key or with a half-key on the shaft extension.

Standard ISO 8821 requires the balancing method to be marked on the shaft extension as follows:

- Half-key balancing: letter H
- Full key balancing: letter F
- No-key balancing: letter N

The machines in this catalogue are in vibration class level A - level B is available on request.

Measuring system for suspended machines

Measuring system for machines on flexible mountings

The measurement points quoted in the standards are indicated in the drawings above.

At each point, the results should be lower than those given in the tables below for each balancing class and only the highest value is to be taken as the "vibration level".

Measured parameters

The vibration speed can be chosen as the variable to be measured. This is the speed at which the machine moves either side of its static position. It is measured in mm/s.

As the vibratory movements are complex and non-harmonic, it is the root mean square (rms) value of the speed of vibration which is used to express the vibration level.

Other variables that could also be measured are the vibratory displacement amplitude (in μm) or vibratory acceleration (in m/s^2).

If the vibratory displacement is measured against frequency, the measured value decreases with the frequency: high-frequency vibrations cannot be measured.

If the vibratory acceleration is measured, the measured value increases with the frequency: low-frequency vibrations (unbalanced loads) cannot be measured here.

The rms speed of vibration is the variable chosen by the standards.

However, if preferred, the table of vibration amplitudes may still be used (for measuring sinusoidal and similar vibrations).

Vibration level and maximum speeds

The motors are vibration level class B at 100 Hz

MAXIMUM VIBRATION MAGNITUDE LIMITS (RMS VALUES) IN TERMS OF DISPLACEMENT, SPEED AND ACCELERATION FOR A FRAME SIZE H (IEC 60034-14)

Vibration level	Frame size H (mm)								
	80 < H ≤ 132			132 < H ≤ 280			H > 280		
	Displacement µm	Speed mm/s	Acceleration m/s ²	Displacement µm	Speed mm/s	Acceleration m/s ²	Displacement µm	Speed mm/s	Acceleration m/s ²
A	25	1.6	2.5	35	2.2	3.5	45	2.8	4.4
B	11	0.7	1.1	18	1.1	1.7	29	1.8	2.8

For large machines and special requirements with regard to vibration, balancing can be carried out *in situ* (finished assembly). Prior consultation is essential, as the machine dimensions may be modified by the necessary addition of balancing disks mounted on the shaft extensions.

MECHANICAL SPEED LIMITS FOR MOTORS WITH VARIABLE FREQUENCY

With increasingly extensive frequency ranges, frequency inverters can, in theory, control a motor at 2 to 3 times its rated speed.

However, the bearings and type of balancing selected for the rotor dictate a maximum mechanical speed which

cannot be exceeded without endangering the motor and its service life.

The table below specifies the maximum speeds that LSMV motors operating in a horizontal and vertical position can withstand.

These speed limit values are given for motors coupled directly to the machine being driven (without radial or axial load).

The formula for calculating the greasing interval *l'g* at frequency *f* is on average:

$$l'g = \frac{25lg}{f}$$

l'g = greasing interval

Maximum mechanical speeds for LSMV 2, 4 and 6 P motors

Type	80	90	100	112	132	160	160 LUR	180	200	225 SR/MT	225 MG*	250	280 SD	280 MK	315
Speeds	15000	12000	10000	10000	7500	6000	6000	5600	4500	4300	4000	4000	3400	3200	2700

* For *n* > 3000 rpm, fit roller bearings with grease nipples.

Any motor running at 4000 rpm has to be specially designed.

In the case of brake motors, see the brake selection tables to find the mechanical speed limits.

For encoder options, operation at high speed can generate saturated signals.

Quality commitment

Leroy-Somer's quality management system is based on:

- Control of procedures right from the initial sales offering until delivery to the customer, including design, manufacturing start-up and production

- A total quality policy based on making continuous progress in improving operational procedures, involving all departments in the company in order to give customer satisfaction as regards delivery times, conformity and cost

- Indicators used to monitor procedural performance

- Corrective actions and advancements with tools such as FMECA, QFD, MAVP, MSP/MSQ and Hoshin type improvement workshops on flows, process re-engineering, plus Lean Manufacturing and Lean Office

- Annual surveys, opinion polls and regular visits to customers in order to ascertain and detect their expectations.

Personnel are trained and take part in analyses and actions for continuous improvement of our procedures.

Leroy-Somer has entrusted the certification of its expertise to various international organisations.

Certification is granted by independent professional auditors, and recognises the high standards of the **company's quality assurance procedures**. All activities resulting in the final version of the machine have therefore received official certification **ISO 9001: 2008 from the DNV**. Similarly, our environmental approach has enabled us to obtain certification ISO 14001: 2004. Products for particular applications or those designed to operate in specific environments are also approved or certified by the following organisations: LCIE, DNV, INERIS, UL, CSA, BSRIA, TUV, GOST, which check their technical performance against the various standards or recommendations.

ISO 9001 : 2008

Standards and approvals

**Our motors comply with the standards
quoted in this catalogue**

Duty cycle - Definitions

DUTY CYCLES

(IEC 60034-1)

The typical duty cycles are described below:

1 - Continuous duty - Type S1

Operation at constant load of sufficient duration for thermal equilibrium to be reached (see figure 1).

2 - Short-time duty - Type S2

Operation at constant load during a given time, less than that required for thermal equilibrium to be reached, followed by a rest and de-energized period of sufficient duration to re-establish machine temperatures within 2 K of the coolant (see figure 2).

3 - Intermittent periodic duty - Type S3

A sequence of identical duty cycles, each consisting of a period of operation at constant load and a rest and de-energized period (see figure 3). Here, the cycle is such that the starting current does not significantly affect the temperature rise (see figure 3).

4 - Intermittent periodic duty with starting - Type S4

A sequence of identical duty cycles, each consisting of a significant starting period, a period of operation at constant load and a rest and de-energized period (see figure 4).

5 - Intermittent periodic duty with electrical braking - Type S5

A sequence of periodic duty cycles, each consisting of a starting period, a period of operation at constant load, a period of rapid electrical braking and a rest and de-energized period (see figure 5).

6 - Periodic continuous duty with intermittent load - Type S6

A sequence of identical duty cycles, each consisting of a period of operation at constant load and a period of operation at no load. There is no rest and de-energized period (see figure 6).

7 - Periodic continuous duty with electrical braking - Type S7

A sequence of identical duty cycles, each consisting of a starting period, a period of operation at constant load and a period of electrical braking. There is no rest and de-energized period (see figure 7).

8 - Periodic continuous duty with related changes of load and speed - Type S8

A sequence of identical duty cycles, each consisting of a period of operation at constant load corresponding to a predetermined rotation speed, followed by one or more periods of operation at other constant loads corresponding to different rotation speeds (in induction

motors, this can be done by changing the number of poles). There is no rest and de-energized period (see figure 8).

9 - Duty with non-periodic variations in load and speed - Type S9

This is a duty in which the load and speed generally vary non-periodically within the permissible operating range. This duty frequently includes applied overloads which may be much higher than the full load or loads (see figure 9).

Note - For this type of duty, the appropriate full load values must be used as the basis for calculating overload.

10 - Operation at discrete constant loads - Type S10

This duty consists of a maximum of 4 discrete load values (or equivalent loads), each value being applied for sufficient time for the machine to reach thermal equilibrium. The minimum load during a load cycle may be zero (no-load operation or rest and de-energized period) (see figure 10).

Note: Only S1 and S3 duty types with a duty factor of 80% or more are affected by IEC 60034-30

 IEC60034-1
 Inverter Duty - PTC 150°C

Plate 2

DEFINITION OF SYMBOLS USED ON NAMEPLATES

Legal mark of conformity of product to the requirements of European Directives

Conformity of product to the requirements of Canadian and American Directives

MOT 3 ~ : Three-phase A.C. motor
LSMV : Series
132 : Frame size
M : Housing symbol
T : Impregnation index

Motor no.

999999 : Motor batch number
N : Month of production
12 : Year of production
0001 : Serial number
IE2 : Efficiency class
89.2% : Efficiency at 4/4 load

IP55 IK08 : Ingress protection
I cl. F : Insulation class F
40°C : Ambient operating temperature
S1 or S9 : Duty - Duty (operating) factor
kg : Weight
V : Supply voltage
Hz : Supply frequency
rpm : Revolutions per minute (rpm)
kW : Rated output power
cos φ : Power factor
A : Rated current
 - Plate 1: on the mains
 - Plate 2: on frequency inverter
Δ : Delta connection
Y : Star connection

Bearings

DE : Drive end bearing
NDE : Non drive end bearing

: Vibration level

: Balancing mode

Please quote when ordering spare parts

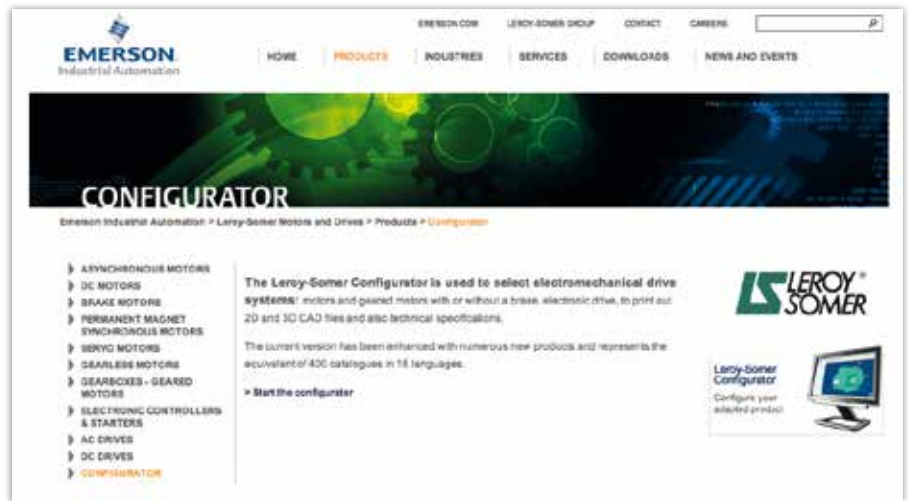

Configurator

The configurator can be used to choose the most suitable motor and variable speed and provides the technical specifications and corresponding drawings.

- Help with product selection
- Print-outs of technical specifications
- Print-outs of 2D and 3D CAD files
- The equivalent of 400 catalogues in 16 languages

To register online:
<http://www.emersonindustrial.com/EN-EN/LEROY-SOMER-MOTORS-DRIVES/PRODUCTS/CONFIGURATOR/>

Product availability

Being able both to respond to urgent requests and adhere to promised customer lead times calls for a powerful logistics system.

The availability of motors is ensured by the network of approved partners and Leroy-Somer central services all working together.

The selection data in the "Guaranteed Availability Drive systems" catalogue specify for each family in the form of a colour code and according to the quantities per order, the product delivery time.

Please consult Leroy-Somer.
